Class Practical Submission

SEC: Frontend Web Design and Development

Submission Deadline: Friday, October 30, 2026

Important Note: All the exercises listed in this document have already been solved and explained during our practical classes. These detailed instructions are primarily intended for students who could not attend those classes, so that they can understand how to complete the exercises and follow the entire submission process correctly.

Objective: Recreate the webpage shown in the reference image supplied with your assigned exercise. Write and test your HTML/CSS code, upload the complete project to GitHub, publish a live webpage with GitHub Pages, and submit both URLs using the Google Form.

1. Understand the exercise folders

The **Exercises** directory contains two main folders: **Basic HTML** and **CSS**. Each folder contains individual exercise/project folders.

Basic HTML Folder	CSS Folder
• 2.1 Heading Element	• 5.1 Adding CSS
• 2.3 Void Elements	• 5.3 CSS Selectors
• 2.4 Movie Ranking Project	• 5.4 Color Vocab Project
• 3.0 List Elements	• 6.3 CSS Box Model
• 3.2 Anchor Elements	• 6.4 Motivation Meme Project
• 3.3 Image Elements	• Monuments of india
• 3.4 Birthday Invite Project	• Student Registration Form
• 4.0 File Paths	• Tables
	• Time Table

Each project folder includes an `index.html` file and a reference image. The reference image is a *visual target*; it is not a substitute for writing code. Other supporting files may be included depending on the exercise. Click the link below to download all the exercises above.

Folder URL: https://up.s.gy/sec-front-end

Scan here

2. Download and open the project

(i) Download your assigned project folder from the shared course materials. If it is a ZIP archive, extract it first.

(ii) Keep the full folder structure intact, including images and other supplied assets.

(iii) Launch **Visual Studio Code (VS Code)**.

(iv) Choose **File** → **Open Folder**, select the downloaded project folder, and click **Select Folder**.

(v) In the Explorer sidebar, confirm that `index.html` and the reference image are visible.

3. Study the reference and write your code

(i) Open the reference image and examine the headings, text, images, spacing, colors, alignment, and overall layout.

(ii) Open `index.html` and write or update the HTML needed to recreate the reference design. Add CSS where required by the exercise; you may use a separate `style.css` file if appropriate.

(iii) Use correct HTML structure, meaningful elements, and valid relative paths for images and stylesheets.

(iv) Save your changes regularly (**Ctrl**+**S**).

(v) Preview the page in a browser (for example, open `index.html` or use an approved VS Code preview extension). Compare it with the reference image and correct any differences.

(vi) Check that text, images, links, forms, and layout work as intended. Do not submit only a screenshot or an unchanged starter file.

4. Create a GitHub repository and upload files

(i) Sign in to github.com (create an account if needed).

(ii) Select **New repository**. Give it a descriptive name matching your project — for example, `movie-ranking-project`. Repository names should avoid spaces.

(iii) Choose **Public** so your instructor can inspect the project, then create the repository.

(iv) Upload the *contents* of the project folder, including `index.html`, the reference image, CSS, and any other required assets. Keep `index.html` at the repository root for the simplest GitHub Pages setup.

(v) Commit the uploaded files. Confirm that the repository displays the complete project.

Alternative: You may push the project from VS Code using Git, following the GitHub upload guide already shared in the class group.

5. Publish the webpage with GitHub Pages

(i) Open your project repository on GitHub and select **Settings** → **Pages**.

(ii) Under **Build and deployment**, choose **Deploy from a branch**.

(iii) Select your default branch (usually `main`) and the `/(root)` folder; click **Save**.

(iv) Wait for deployment to finish. GitHub will provide a public webpage address, usually of the form `https://USERNAME.github.io/REPOSITORY/`.

(v) Open the live URL in a new browser tab. Verify that the design, images, CSS, and links load correctly. If changes are needed, update the repository and allow the site to redeploy.

Important distinction: The **repository URL** shows your source code and project files; the **live webpage URL** displays your published website. You must submit *both* URLs. GitHub Pages works for static HTML/CSS/JavaScript projects.

6. Finally, Submit the Class Practicals via Web Form

After completing the class practical exercise and confirming both links work, open the web form:

Web Form URL: https://up.s.gy/front-end-assessment-submission

Scan here

Enter the requested student details (such as name, roll number, and class/section), the assigned project name, your **GitHub repository URL**, and your **GitHub Pages live URL**. Review every entry carefully and submit the form before the deadline.

Example URLs (replace with your own):

- Repository: https://github.com/USERNAME/movie-ranking-project
- Live webpage: https://USERNAME.github.io/movie-ranking-project/

Deadline: Friday, October 30, 2026 Complete all steps and submit the Google Form by this date. The detailed GitHub/VS Code guide has already been shared in the class group; consult it if you need help with setup or publishing.
